CHAPTER II

The History of the Japanese Securities Market

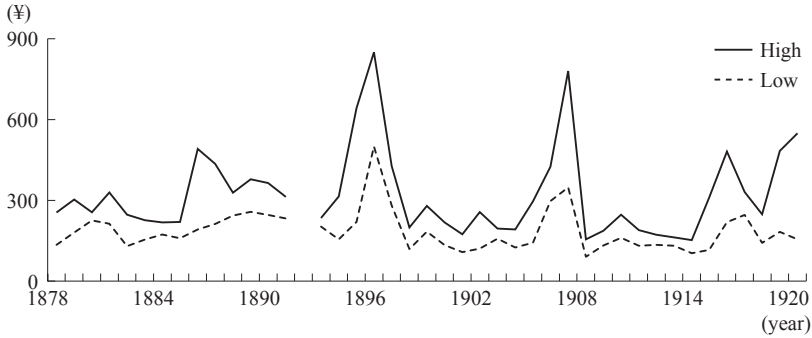

1. The Securities Market in the Prewar Period

If we take the point of origin of Japan's securities market to be the first issuance of securities, this occurred in 1870 with the issue of a foreign currency denominated government bond bearing 9% interest in London, England. If we consider the birth of a secondary market based on a legal ordinance, this happened in 1878 with the establishment of stock exchanges in Tokyo and Osaka. Whichever definition is used, Japan's securities market has been in existence for about 150 years. The stock exchanges started off as markets for trading government bonds, such as as old and new public bonds and *chitsuroku* bonds Although the stocks of the exchanges and banks were later listed, government bonds continued to account for the majority of trading for some time. Around 1886, there was a period of rapidly emerging businesses, mainly railway and textile companies, that ushered in more active trading in stocks.

The formation of corporations (*kabushiki kaisha*) in Japan was not related to the huge capital investments that are required to develop the heavy and chemical industry. Instead, corporations were introduced to deal with the low level of capital accumulation in the economy. In conjunction with that action, schemes were established to facilitate the paying in of capital, such as the stock installment payment system and stock collateral loans. As a result, the corporations set up in the Meiji era were mostly small companies primarily involved in light industry. These could really be considered as corporations in name only in terms of their generally intended function of raising capital. The turning point for that function in Japan came with the shift in the composition of industry toward he heavy and chemical industry prompted by World War I. Only then did the country see a sharp increase in large albeit mainly financial combine (*zaibatsu*)-related companies with paid-in capital exceeding ¥5 million.

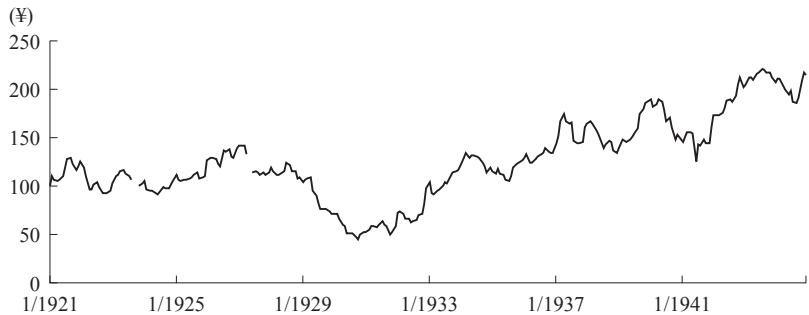

There were practically no shares of major companies listed on stock exchanges in the secondary market because the *zaibatsu* held exclusive ownership of their group companies. And as a result of the lack of investment capi-

tal and inadequate credit provision by banks before World War II, the secondary market developed around futures trading called settlement dealings and forward transactions. Even the main trading issues of exchanges' stocks were subject to speculative investment. For that reason, the prewar stock market can be characterized as speculative. Another feature that can be highlighted in retrospect is the imposition of wartime regulations. Following the Showa depression, the government sought to achieve economic recovery by devaluing the currency to promote exports and by creating inflation through expansive government spending, principally on the military. After the outbreak of the Sino-Japanese War, the government implemented a war-

time regime and imposed regulations on the securities market. It restricted the issuance of securities for non-essential industries, instituted planned corporate bond issuance, put controls on stock prices, and introduced a licensing system for securities companies. Japan's 11 stock exchanges, furthermore, were merged into the Japan Securities Exchange in 1943.

2. The Period of Postwar Economic Rehabilitation (1945−54)

After the war, Japan was placed under the control of the General Headquarters (GHQ) of the Supreme Commander for the Allied Powers. There was immediate movement within Japan's securities industry to reopen the market. At one point, in fact, the Ministry of Finance decided to restart the stock exchanges on October 1, 1945. However, the GHQ did not approve this, and the market was not reopened. The securities industry continued to lobby en-

thusiastically for a restart of market operations, but the GHQ rejected the idea as premature and instead gave priority to economic reforms (land reform, dismantling of the *zaibatsu*, and labor reform), as well as political and social reforms. Consequently, it took nearly four years to reopen the stock exchanges, during which time the Japan Securities Exchange remained

closed. This has been the only "blank period" in the operation of stock exchanges in the history of the securities market in Japan.

Despite trading being halted on the floors of the stock exchanges and official secondary market, the demand for securities trading persisted even in the confusion of postwar Japan. Securities trading naturally emerged at the offices of securities companies in the form of over-the-counter (OTC) trading. When it became clear, moreover, that the stock exchanges were not going to restart anytime soon, "group transactions," which involved institutionalized OTC trading at fixed locations and times in parallel with the OTC trading at individual securities companies, also got under way. By the end of 1945, group transactions, which first emerged in Tokyo and Osaka, had spread to Nagoya, Niigata, Kyoto, Kobe, Hiroshima, Fukuoka, and other cities.

It would, of course, have been difficult to reopen the stock exchanges merely by continuing the prewar exchange organization and securities legislation. To democratize the securities industry, the Japanese government com-

menced the formulation of a new legal framework. In 1947, it promulgated the Securities and Exchange Law, which drew on the Securities and Exchange Act of the United States. Initially, only those articles of the law dealing with the Securities and Exchange Commission, which was patterned after the U.S. Securities and Exchange Commission (SEC), were enforced. Then a full-scale revision of the law was promulgated in 1948. This amended law formed the legal framework for the new postwar securities market, replacing the licensing system for securities companies with a system of registration with the regulatory authority and putting in place regulations such as the separation of banking and securities businesses.

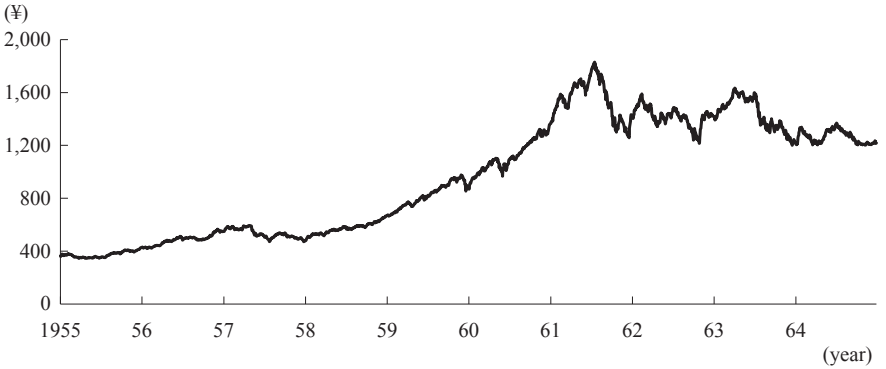

Stock exchanges were established in Tokyo, Osaka, Nagoya, and other cities from May 1949. The GHQ, however, instructed Japan's Securities and Exchange Commission to ensure the strict observance of its Three Principles of Market Operation: (1) recognize transactions in order of the occurrence, (2) concentrate trading on stock exchanges, and (3) prohibit futures trading. All stock exchanges pledged to strictly follow these principles, enabling the long-awaited reopening of stock exchanges (participants in group transactions and the issues they had traded moved en masse to these stock exchanges and restarted trading on a cash transaction basis only). However, because it was difficult to match buys and sells based only on actual demand, a movement got under way in the industry to push for the revival of prewar forward transactions for the purpose of introducing hypothetical demand. Since the management of the exchanges and the GHQ were against this proposal, a margin trading system modeled on the U.S. margin trading system was introduced in 1951.

3. The Securities Market during the First Period of Rapid Economic Growth (1955−64)

As indicated by the statement "The postwar period is over" in the 1956 Economic White Paper, Japan completed its postwar recovery in the latter half of the 1950s and entered its first period of rapid economic growth, exemplified by the Jinmu and Iwato booms. Against a backdrop of favorable growth in corporate performance, stock prices rose almost universally during the period from the latter half of 1955 to July 1961. An investment trust boom at the time also contributed to the rising securities market.

Japan had introduced a postwar securities investment trust system in 1951, but the market for these investment trusts struggled until 1955. From 1956 on, however, stock prices surged, and the outstanding principal of investment trusts expanded sharply. Investment trusts became such a force in the securities market that they were referred to as the "whale in the pond." Another

factor in the bull market was the system of "investable custody." Under that system, securities companies borrowed bank debentures (primarily discount bank debentures) that they had sold in the market on a commission basis from unspecified multiple customers for a predetermined fee through a custody system. The securities companies then raised capital from small and medium-sized financial institutions or in the call money market by using the bank debentures as collateral and invested it in stocks or bonds through their own proprietary trading accounts. In this manner, against the backdrop of an expanding economy and bullish securities market, OTC trading value rose sharply, and the number of companies approved to sell their securities OTC grew rapidly, concentrated mainly on start-up and growth companies. To deal with the rapid expansion in the OTC market, the Tokyo, Osaka, and Nagoya stock exchanges each established Second Sections.

Japan, though, was striving to balance its current account, and when the balance of payments fell into the red it tightened the money supply. When the interest rate was raised in July 1961 to improve the balance of international payments, Japanese companies began liquidating their stockholdings. In combination with corporations' focus on increasing capital, this trend caused a worsening in the demand-supply balance for stocks. The resultant drop in stock prices forced an end to the investment trust boom, as the mechanism that had been driving up stock prices reversed and caused further declines in stock prices. The increase in the official discount rate also produced a rise in the number of redemptions of bond investment trusts, especially by compa-

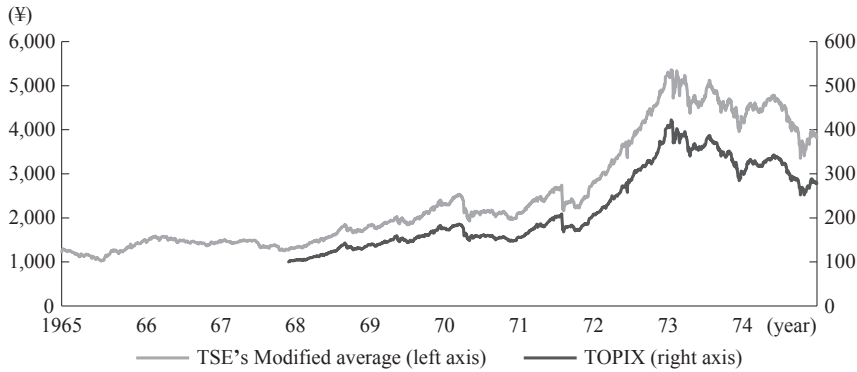

nies. This action placed a great financial burden on the securities companies, which were forced to buy bonds that were being removed from the pool of investment trust assets. These factors became a cause of panic in the securities market.

For that reason, the market took steps, such as urging business corporations to rearrange their financing plans (cutting back or postponing their planned increase of capital) and persuading commercial banks to make loans secured by bonds to four bond investment trusts. Despite these efforts, stock prices continued to decline, partly because of the Kennedy Shock triggered by the proposed U.S. Interest Equalization Tax. To deal with the issues, the industry formed stock purchasing organizations. In January 1964, banks and securities companies contributed capital to create the Japan Joint Securities Co., Ltd., while in January 1965 a group of securities companies jointly established the Japan Securities Holding Association. Both of these organizations carried out share purchasing operations in the market and assumed ownership of shares held by investment trusts with the aim of improving the demand and supply balance in the stock market. In the latter part of May 1965, however, the news that Yamaichi Securities Co., Ltd., was on the verge of bankruptcy hit the market, plunging it into a state of panic.

4. The Securities Market during the Second Period of Rapid Economic Growth (1965−74)

The curtain rose on the 10-year period from 1965 onward with a securities panic. At the end of the first half of fiscal 1964 (September 30, 1964), the cumulative losses of securities companies in Japan amounted to ¥26.4 billion. In particular, Yamaichi Securities' performance had deteriorated significantly. By March 31, 1965, the company had racked up a loss of ¥28.2 billion, compared with total capital of only ¥8 billion. On May 21, 1965, it was revealed that Yamaichi Securities was on the brink of failure. To avoid a loss of confidence in the market, a move was made to bail out the company. Late at night on May 28, the government invoked Article 25 of the Bank of Japan Act and announced that Yamaichi Securities would receive a special unsecured loan from the Bank of Japan for an unlimited amount (although in actual fact some collateral was secured). Stock prices continued to fall for some time following the announcement but rallied when the government made clear that it intended to issue deficit-covering bonds for the first time since the war. Meanwhile, the panic in the securities market also served as the basis for a reorganization of the securities industry. The government amended the Securities and Exchange Act, introducing a licensing system for securities companies. This forced many securities companies to combine their operations, or

Chart II-5. Stock Price Movement (TSE's Modified Average, TOPIX) (1965−1974)

Source: Compiled from data the *Shoken tokei yoran* (Manual of Securities Statistics), the *Nihon Keizai Shimbun*, and the *Tosho tokei nenpo* (TSE Annual Report).

merge, to prepare for the new system. In combination with the securities companies that had their registration revoked around the time of the securities panic and those that dissolved their operations, the number of securities companies at the time of the conversion to the new licensing system declined to 277 companies, compared with 593 companies at the end of 1963.

During the decade from 1965 to 1974, progress was made in internationalizing Japan's securities market. In 1964, Japan became an Article 8 country member of the International Monetary Fund (IMF), joined the Organization for Economic Cooperation and Development (OECD), and publicly promised to liberalize capital transactions. Consequently the government implemented measures to liberalize the capital market in five stages beginning in July 1967. This process steadily eased the restrictions on ownership of Japanese stock by foreigners, and these were finally fully lifted with the exception of certain stock categories. The liberalization of capital transactions was not limited to foreign investors; foreign issuers and intermediates were also able to operate in Japan's securities market. In 1970, the Asian Development Bank started issuing yen-denominated foreign bonds in Japan. Foreign shares were made available to buy in Japan in 1972. The Tokyo Stock Exchange established a Foreign Section in 1973. Around the same time, foreign securities companies commenced operations in Japan. Merrill Lynch opened a Tokyo branch in 1972, becoming the first foreign securities company to receive a securities business license in Japan.

The liberalization of capital transactions also meant that it was now possible for foreign companies to take over Japanese companies. Japanese companies countered this new threat by focusing on building stable shareholder

bases. If companies held shares in each other, this reduced the number of shares available in the market, making it easier to defend against takeover attempts. Cross-shareholdings were viewed from the perspective of takeover prevention. Later, after Japanese companies switched the format of their capital increases from rights issues to existing shareholders at par value to public offerings of stock at market prices, issuers pursued share crossholdings because they favored a high share price for their public offerings. As a result, there was a change in the shareholding composition of the market, with the proportion of corporate shareholdings increasing and the proportion of individual investor shareholdings declining.

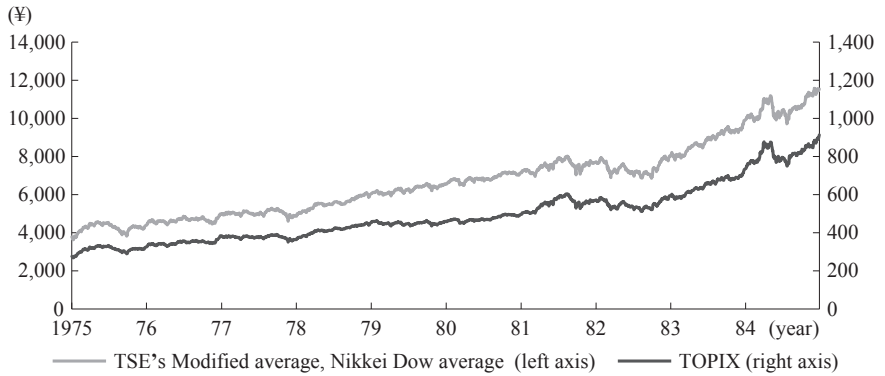

5. Measures Taken to Cope with the Oil Crisis (1975−84)

At the end of the previous 10-year period, there had been a succession of major events that shook the Japanese economy, including the Nixon Shock (1971), the introduction of a floating exchange rate system (1973), and the first oil shock (1973). The second oil shock occurred later, in 1979. With Japanese companies practicing energy conservation management in the face of back-to-back oil crises, the government seemed intent on getting through the crises using a fiscal expansion strategy. Underpinning that strategy was the massive issuance of deficit-covering Japanese government bonds (JGBs).

As previously mentioned, government bond issuance after the war began in fiscal 1965. The main feature of these bonds was that they were issued at low interest rates without regard to market conditions and were forcibly allocated among financial institutions belonging to the underwriting syndicate according to their capital strength. Maintaining this artificially low and fixed interest rate market meant that financial institutions could not be permitted to sell JGBs freely in the market. Since the government was trying to keep JGB issuance at that time within the scope of the growth in the money supply, the Bank of Japan purchased almost all JGBs that had been held by the financial institutions for one year (liquidity policy). The reason, in fact, that JGB issuance after the oil shocks was said to be massive was that JGB issuance after fiscal 1975 exceeded the growth in the money supply.

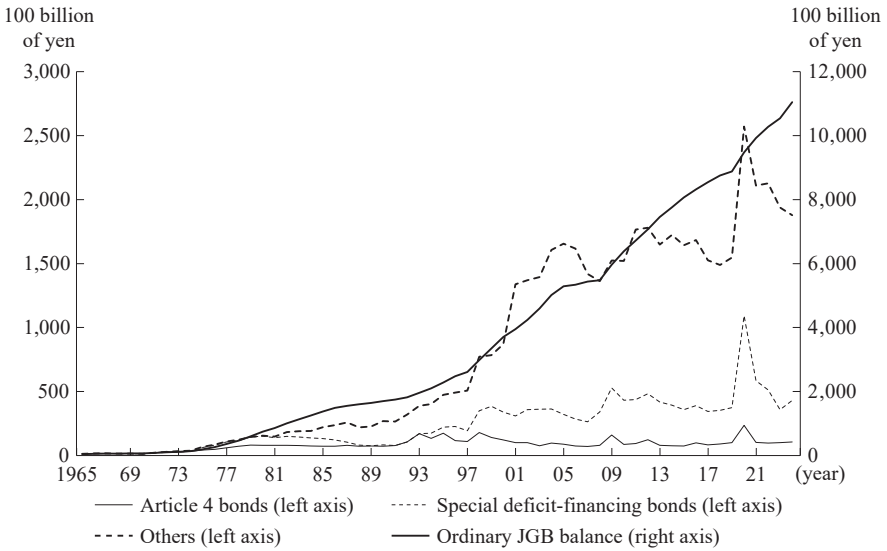

With the massive issuance of JGBs, the liquidity policy reached its limits, making it impossible to avoid issuing JGBs in the public market. Accordingly, the government approved JGB sales on the bond market in 1977 with certain restrictions. Following this change, the restrictions on sales were liberalized in stages, resulting in the deregulation of the JGB secondary market. The interest rate yields for JGB subscribers, on the other hand, were the base rates given by the regulated interest rate structure in Japan. To deregulate these rates would have forced the government to change its artificially regu-

lated interest rate policy. For this reason, there was significant resistance to the deregulation of the JGB primary market within the government, and deregulation proceeded at a snail's pace. However, when the designated underwriting syndicate refused to underwrite the planned issuance of JGBs in June 1981, issuance conditions for JGBs were deregulated, setting the stage for deregulation of the different types of long-term interest rates.

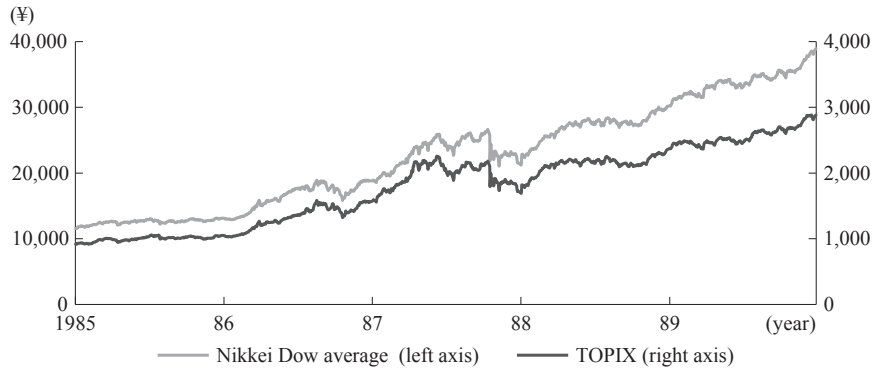

Another development during this period was internationalization. During the period from 1975 to 1984, Japan's trade surplus with the United States ballooned, causing trade and economic friction between the two countries. Perceiving the reason for the problem to be the closed nature of Japan's financial, capital, and service markets, the United States demanded the overall reform of Japan's economic structure. As part of that process, the two countries formed the Japan-U.S. Yen/Dollar Committee. The United States argued that deregulated financial and capital markets driven by a market mechanism would enable the optimum allocation of capital in Japan. It therefore pushed strongly for the removal of various restrictions placed on those markets by the Japanese government that it considered obstructive to open markets. In this manner, internationalization formed the basis for financial deregulation in Japan.

6. Developments before and after the Economic Bubble (1985−89)

In a Japan-U.S. Yen/Dollar Committee Report released in 1984, the United States brought pressure on Japan to liberalize its financial and capital markets and to internationalize the yen. The Japanese government responded by liberalizing the domestic financial market through actions such as deregulating interest rates on bank deposits. It also moved to improve foreign financial institutions' access to the Japanese market through measures such as opening up membership on the Tokyo Stock Exchange (TSE). As the first step toward internationalizing the yen, the government liberalized the Euroyen market. The TSE, meanwhile, heeded the request of the government to open its membership by revising the fixed number of membership seats in its Articles of Incorporation in 1985 and accepting its first round of new members. A total of three rounds were eventually conducted, resulting in seats on the TSE for 25 foreign securities companies.

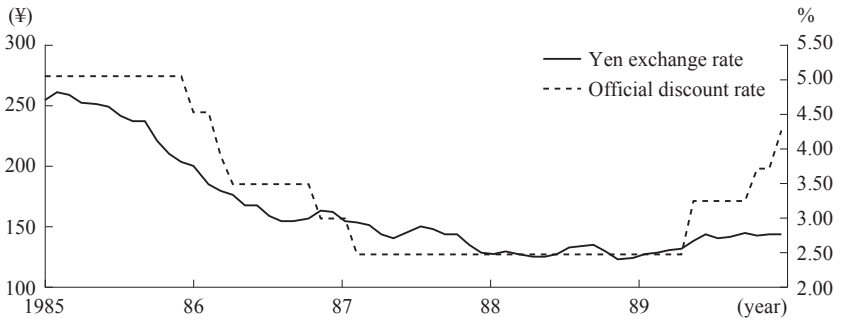

The deregulation of interest rates began in 1985 with the deregulation of interest rates on large deposits. After that, the deregulation of interest rates on deposits progressed rapidly. As a result, the proportion of funds raised by banks at market interest rates jumped to 53% in 1989 from 7.5% at the end of fiscal 1984, greatly increasing banks' funding costs. Major corporations concurrently shifted their financing from bank loans to security issuance, result-

ing in a decline in the balance of loans being extended by major banks to their core customer base (he heavy and chemical industry). To cope with the loss of business, the leading Japanese banks expanded the scope of their loan operations to include real estate, construction, and other industries and launched international operations. They also began planning to enter the securities business, creating friction between the banking and securities industries.

In 1985, the Plaza Accord was signed, after which the yen appreciated sharply against the U.S. dollar. The rate movement raised concerns about a strong yen-related economic recession in highly export-dependent Japan. The

Bank of Japan's reaction was to implement successive reductions in the official discount rate from January 1986 onward, and the economy responded by entering a recovery phase. Amid this low interest rate climate, Black Monday rocked the U.S. market on October 19, 1987, causing nations around the world to initiate monetary easing to avert recessions. Japan, meanwhile, was still in an economic recovery phase, and its official discount rate remained at a low level. Consequently, the price of land and stocks continued to rise. Against this backdrop of asset inflation, corporations began taking advantage of their ability to raise capital through bank loans and securities, using financial engineering, or *zaitech*, to boost their financial income. Financial institutions, hurt by the decline in loan balances, also aggressively invested capital in securities. Increased investment in securities pushed the Nikkei Dow index up from ¥12,716.52 (September 30, 1985) before the Plaza Accord to a record high of ¥38,915.87 at the end of 1989.

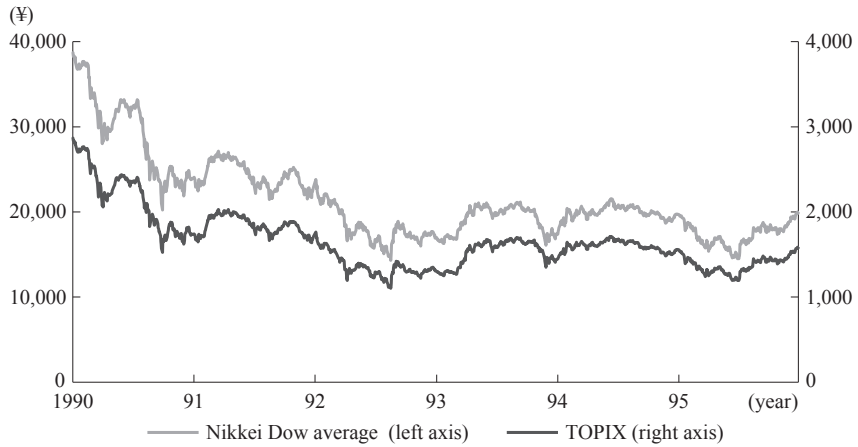

New trading methods were also introduced during this period, commencing with bond futures trading in 1985. Stock index futures trading was introduced in 1987, and stock index options in 1989. Japan's securities market thus gained a full complement of cash, future, and options trading.

7. The Reform of the Financial System after the Stock Market Scandals (1990−95)

The debate on financial system reform began in Japan in the mid-1980s. It arose in response to the global trend toward financial deregulation and to the change in the financing methods of Japanese corporations. The Financial System Research Council took the lead in the debate with a review of the specialized financial institution system, including the separation of long-term finance from short-term finance, commercial banks from trust banks, and the banking industry from the securities industry. These systems were the pillars of the postwar financial system in Japan. The Financial System Research Council, however, was positive about banks being allowed to enter the securities business and decided that the best approach would be to allow mutual entry into the banking, trust and securities businesses based on wholly-owned subsidiaries. It requested the Securities and Exchange Council to revise the system separating the banking and securities industries. But the Securities and Exchange Council was wary of allowing banks into the securities business, recognizing that the securities industry overall was far less enthusiastic about this idea than the banking industry. The Securities and Exchange Council nevertheless decided to approve mutual entry through subsidiaries on the condition that firewalls were established between subsidiaries and parent companies. And for the time being bank subsidiaries, including indirectly owned subsidiaries, were prohibited from operating in the stock brokerage market. The Institutional Reform Law was enforced in June 1992 based on those conditions, and mutual entry into these financial sectors became a reality.

Around the time that the debate on financial system reform was dying down, the uncovering of major financial and securities scandals shook the banking and securities industries. For the securities industry scandals were unveiled by tax audits showing that during the financial bubble major securities companies had been compensating their largest corporate clients for losses incurred (in August 1991, total compensation by the four major securities companies and 17 second-tier and medium-sized companies had reached approximately ¥172 billion). Dealings with members of known crime syndicates and market manipulation charges also surfaced, escalating the problems into a social issue. Most of the loss compensation related to *eigyo tokkin* accounts (discretionary accounts managed by the securities company). The commonly used methods involved arranging to have the client earn a profit on transactions disguised as bond transactions or shifting losses between corporate clients with differing fiscal year-ends to avoid reporting the loss by temporarily transferring securities with losses at book value between their

accounts in a process called *tobashi*.

Since at that time it was not actually illegal to pay compensation for losses on trades after the fact, the Securities and Exchange Act was immediately amended to ban securities trading under a discretionary account and loss compensation before or after the fact. Criticism mounted that "excessive profits of securities companies due to the regulator's protection, problematic administration, and fixed rate commissions had made loss compensation possible." It was said that "the required solution is not the banning of loss compensation or the punishment of securities companies, but the implementation of financial system reform itself." In September 1991, the Provisional Council for the Promotion of Administrative Reform recommended the liberalization of brokerage commissions, the promotion of new market entries, and the separation of the market surveillance organization from the Ministry of Finance. In July 1992, the authorities established the Securities and Exchange Surveillance Commission. The rest of the Provisional Council's recommendations were included in the financial Big Bang reforms that came later, contributing to the formation of a new framework for Japan's financial and capital markets.

8. The Debate on, and Enforcement of, the Act on Revision, etc. of Related Acts for the Financial System Reform (1996−2000)

The bursting of the economic bubble left deep scars on the economy. The trauma from the collapse of stock prices emerged in the form of securities scandals, while that from the collapse of land and real estate prices manifested itself as the non-performing loan problem in the financial industry. In particular, the non-performing loan problem lingered on without the implementation of a fundamental solution. Subsequently, the banking industry struggled for almost 10 years to resolve the bad debt problem. During this long process, foreign companies and investors and financial transactions withdrew from the Japanese market, making the "hollowing out" of the financial market real. Japan's way of addressing the issue was the financial Big Bang initiative proposed by the prime minister at the time, Ryutaro Hashi-

Chart II-11. Stock Price Movement (Nikkei Dow and TOPIX) (1996−2000)

moto in 1996. The goals of this initiative were to wrap up the cleanup of non-performing loans by 2001 and rebuild the Japanese financial market into an international market comparable to the New York and London markets based on the principles of "free, fair, and global."

Discussions on financial reform took place in the Securities and Exchange Council, the Financial System Research Council, the Insurance Council, the Council on Foreign Exchange and Other Transactions, and the Business Accounting Council. These discussions resulted in recommendations to change Japan's established bank intermediation-based capital allocation system (indirect financing) to a market-based capital allocation system (direct financing). Passed in October 1998, the Act on Revision, etc. of Related Acts for the Financial System Reform called for a wider range of asset management instruments, services based on vigorous intermediation, a market system with special characteristics, and a framework for trading that users could trust. Among its many revisions, the deregulation of stock brokerage commissions and the shift to the registration system of securities companies provided incentive for securities companies to reform their business models. Its elimination of the obligation to trade stocks only on exchanges, on the other hand, promoted competition between markets.

Almost at the same time as the financial Big Bang initiative was being proposed, major financial institutions experienced business and financial crises that led to bankruptcies. The troubled banks included Hokkaido Takushoku Bank, Ltd., the Long-Term Credit Bank of Japan, Ltd., and the Nippon

Table II-11. Schedule for Reforming the Securities Market During the Big Bang

	FY1997	FY1998	FY1999	FY2000	FY2001
I. Investment Vehicles (Attractive investment instruments)					
1. Diversity of the types of bonds					
2. Diversity of derivatives products					
3. Developing Investment Trust Products					
(1) Introduction of Cash Management Account (wrap account)					
(2) OTC sales of investment trusts products by banks					
(3) Private placement of investment trusts					
(4) Investment company type funds					
4. Review of the definition of securities			-----	---->	
5. Enhancement of corporate vitality and efficient use of capital					
II. Markets (An efficient and trust framework for transactions)					
1. Improvement of transaction system on stock exchanges					
2. Improvement of OTC (JASDAQ) market system					
3. Deregulation of sales solicitations by securities firms for unlisted, unregistered stock					
4. Improvement of share lending market					
5. Improvement of clearing and settlement system			-----	---->	
6. Strengthening inspection, surveillance and enforcement systems			-----	---->	
7. Strengthening disclosure			-----	---->	
III. Financial Intermediaries (Diverse investment services to meet client needs)					
1. Deregulating brokerage commissions					
2. Diverse activity by intermediaries					
3. Use of holding company structure					
4. Strengthening asset management					
5. Enhancing monitoring system for soundness of securities companies					
6. Entry regulations for securities companies					
(1) Licensing system reform					
(2) Enhancing mutual entry into banking, securities and trust businesses					
7. Investor protection related to exits of intermediaries from the market					
(1) Strict separation of client assets from securities companies' own assets					
(2) Enhancing the securities Deposit Compensation Fund scheme					
Review of the taxation related to securities					
Shift to the new administrative regime

Credit Bank, Ltd. The list of securities companies included second-tier Sanyo Securities Co., Ltd., and one of the four major securities companies, Yamaichi Securities Co., Ltd. These companies would previously have been rescued by being absorbed by or merged with other major financial institutions. But there were no financial institutions with the financial strength to do this. The myth that banks could not fail was shattered, and the so-called convoy system of securities companies came to an end. Forced into action by the crisis, the major financial institutions reorganized beyond traditional corporate lines, consolidating into four major financial groups. These new groups also began reorganizing their affiliated securities companies from second-tier to small and medium-sized ones. Amid major changes, such as the shift to a registration system and the deregulation of brokerage commissions, an information technology (IT) revolution occurred. This resulted in a rush into the market of securities companies with online brokerage businesses and other new business models, producing a change in key market players.

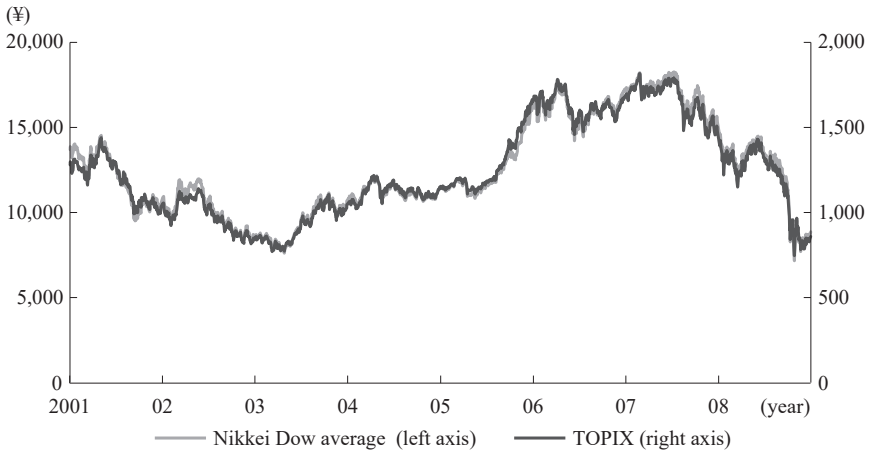

9. Developments Since the Big Bang (2001−08)

Entering the 2000s, the non-performing loan problem reached a turning point. Prime Minister Junichiro Koizumi championed structural reform and oversaw the final clearing of this bad debt from the banking sector based on the Financial Revitalization Program in October 2002 that prioritized eliminating non-performing loans. Because this approach threatened dangerously low levels of capital reserves at banks, a rise in bankruptcies in the corporate sector, and an increase in unemployment, the government took steps to control its adverse effects. It injected capital into banks to maintain the stability of the financial system and established restructuring mechanisms for corporations. These mechanisms included the enactment of the Civil Rehabilitation Act and of the function of the Resolution and Collection Corporation (RCC) and the setting up of the Industrial Revitalization Corporation of Japan (IRCJ).

Under the slogan of "From Savings to Investment," Japan's government also implemented policies and programs to shift to a market-based financial system with a strongly rooted securities market at its core in which a diverse range of investors would participate. The policies and programs included the Basic Policies for Economic and Fiscal Management and Reform (June 2001), the Program for Structural Reform of Securities Markets (August 2001), and the Program for Promoting Securities Markets Reform (August 2002). These policies and programs put an emphasis on the expansion and improvement of sales channels (lifted a ban on banking and securities joint branch offices and introduced a securities intermediary system); the diversification of financial instruments and services (lifted a ban on wrap accounts, etc.); and the fairness and transparency of the financial business (thorough disclosure and the greater supervisory oversight of audit corporations, etc.). The authorities aimed at establishing a market that participants would have confidence in and that would attract a wide range of investors. Thanks to these reforms, the allocation of household financial assets into risk-class assets, such as stocks, bonds, investment trusts, and other securities, trended upward until 2006. However, the reforms also resulted in an increase in the number and volume of complex financial instruments and transactions that demanded a comprehensive set of regulations to ensure the thorough observance of investor protection rules and the coverage of an expanding and increasingly diversified range of investment instruments. In response, the government revised the Securities and Exchange Act, reintroducing it as the Financial Instruments and Exchange Act.

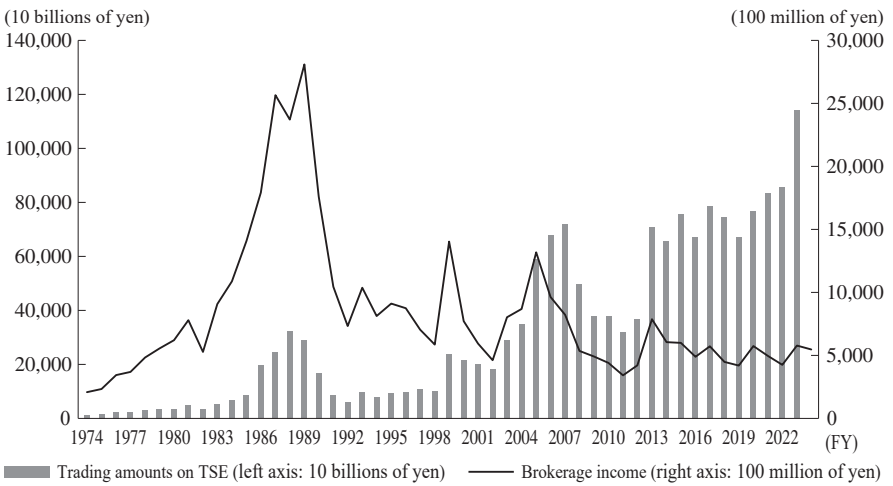

In the aftermath of the financial Big Bang, retail securities business reform and inter-market competition between stock exchanges began in earnest. In

the retail securities business, ever since the liberalization of brokerage commissions, the level of commission income had become sluggish. Therefore leading securities companies that used to focus on the brokerage business shifted direction to a marketing approach that paid greater attention to asset management in an effort to break away from being dependent on market conditions. Meanwhile, inter-market competition was focused on attracting new listings and increased transaction volume. The exchanges started targeting new listings around 2000, launching start-up company markets, and start-up companies and growth companies successively listed their stocks on exchanges. In the battle for greater transaction volume, Tokyo Stock Exchange (TSE) quickly took the lead. The TSE introduced electronic stock trading and off-floor trading, strengthening its dominant position. The concentration of stock trading on the TSE, however, produced a notable decline in support for other regional stock exchanges, leading to successive reorganizations that began around 2000.

10. Changes after the Lehman Crisis (2009−19)

From the summer of 2007 onward, the liquidity crisis at financial institutions in Europe and the United States, triggered by defaults on subprime mortgages due to falling housing prices, escalated into a global financial crisis, plunging the world economy into a simultaneous recession. Furthermore, the Greek debt crisis in 2009 spread to countries with large current account and budget deficits, triggering a crisis among financial institutions in the United Kingdom, France, and Germany, which held significant amounts of government debt in those countries, leading to the European debt crisis. In response, countries staved off this crisis through massive fiscal stimulus and monetary easing.

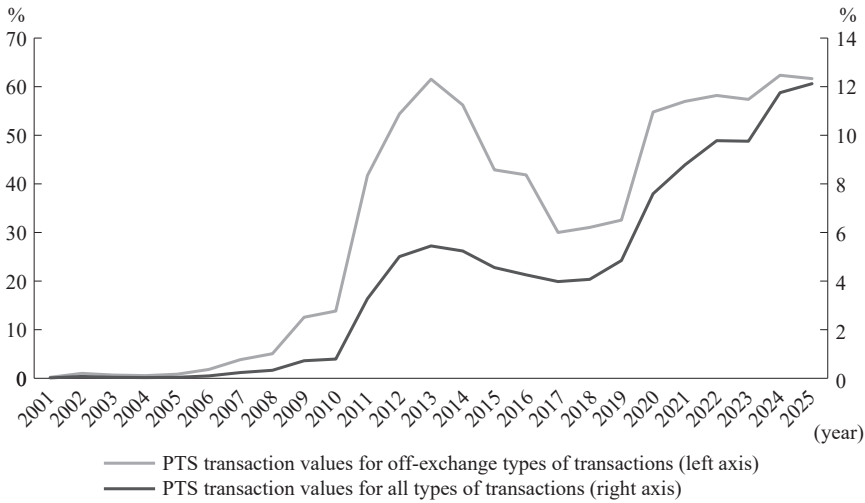

Although Japanese financial institutions suffered fewer losses related to the subprime loan crisis and the European debt crisis than their European and U.S. counterparts, the Japanese economy was severely impacted by the appreciation of the yen against the backdrop of monetary easing in the U.S. and Europe. The Bank of Japan adopted a comprehensive monetary easing policy and began purchasing not only government bonds but also exchange-traded funds (ETFs), but was unable to break the deflationary cycle. When the Liberal Democratic Party regained power at the end of 2012, the Bank of Japan initiated further monetary easing (quantitative and qualitative monetary easing) aimed at combating deflation. Stock prices rose sharply in response to the massive monetary easing. However, the country failed to break out of deflation, and the Bank of Japan introduced a negative interest rate policy in 2016.

Chart II-15. Transactions on Proprietary Trading Systems (as of July 2025)

Source: Compiled from the data published on the website of the Japan Securities Dealers Association.

In parallel with monetary easing, the government also initiated corporate governance reforms in 2014 with the aim of achieving sustainable growth in the Japanese economy and improving corporate value. In 2015, the Corporate Governance Code and Stewardship Code were formulated, and the Companies Act was amended to strengthen the earning power of Japanese companies. The Codes have continued to be revised subsequently, and the 2021 revision of the Corporate Governance Code was a factor in the subsequent significant increase in the number of appointments of independent outside directors and these directors' share of the board of directors.

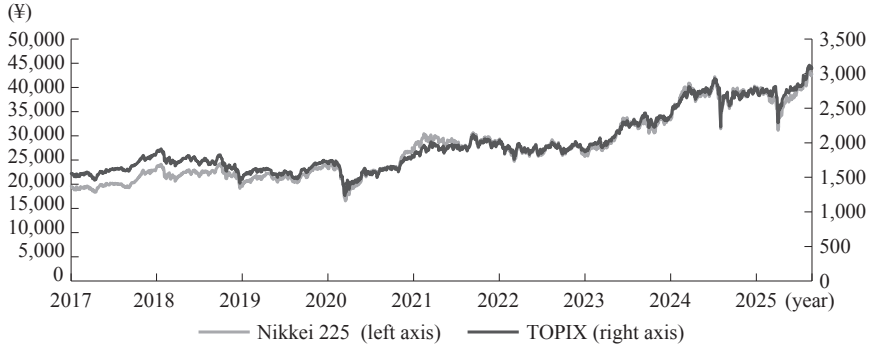

The securities market also saw the entry of high-frequency trading (HFT) in earnest in 2010, when the TSE updated its trading system. A series of deregulations has also led to an increase in the use of proprietary trading systems (PTSs), with PTSs' share of total trading value of listed stocks accounting for more than 5% in 2012. When the ban on margin trading on PTSs was lifted in 2019, trading volume began to increase again and the share of total trading value is now over 10%. Such full-fledged inter-market competition has increased the system costs of the stock exchanges. At the same time, the presence of the Japanese market in the global market has continued to decline. In January 2013, the Tokyo Stock Exchange and the Osaka Securities Exchange merged to create the Japan Exchange Group with the aim of strengthening the international competitiveness of the Japanese market and improving its convenience.

11. Recent Developments in the Securities Market (2020 onwards)

Global monetary easing in the wake of the Lehman Crisis prompted active monetary easing in Japan from 2013 onwards, aimed at overcoming deflation. Accordingly, the Bank of Japan's assets have expanded rapidly, from ¥164 trillion at the end of March 2013 to ¥748 trillion at the end of 2024. Moreover, the Bank of Japan also purchased ETFs and Real Estate Investment Trusts (REITs) not purchased by foreign central banks, amounting to about ¥37 trillion based on book value. Such large purchases of JGBs and ETFs raised concerns that the Bank of Japan's presence in the market was causing a deterioration in the market's proper functioning. More than a decade of global monetary easing began to be unwound in 2022, and the Bank of Japan took the first step toward the normalization of monetary policy in 2024 by deciding to discontinue its ETF purchases and scale back its purchases of JGBs.

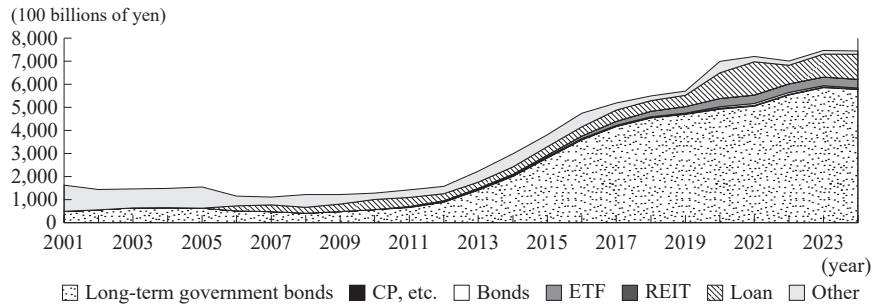

It has often been pointed out that household financial assets in Japan are heavily weighted toward savings and deposits. In 2022, the government launched the Doubling Asset-based Income Plan to achieve sustainable

growth in Japan, aiming to realize a virtuous cycle of growth and increased asset income by linking household financial assets to investment. Specifically, the NISA system was fundamentally expanded and made permanent, the iDeCo contribution limit was raised, financial and economic education was expanded, creating a mechanism to support household investment. Furthermore, the "Policy Plan for Promoting Japan as a Leading Asset Management Center" was announced in 2024, aiming for reforms across the entire investment chain. As a result of these measures, the number of NISA accounts opened increased from 18.01 million at the end of 2022 to 25.59 million at the end of 2024, when the new NISA system started, and the amount purchased in NISA accounts increased from 30 trillion yen at the end of 2022 to 53 trillion yen at the end of 2024. The proportion of investment products in Japanese household financial assets has also begun to increase.

Another change has been the increasing use of IT in securities trading, typified, for example, by high-frequency trading (HFT), robo-advisors and digital securities. HFT, which entered the market in earnest around 2010, is increasing its presence on the TSE, accounting for 35% of total trading value and 75% of orders on the TSE in 2024. In addition, robo-advisor services, which were first launched in Japan in 2016, are seeing an increase in users, especially among those in their 20s and 30s. Assets under management for specialized firms alone were in excess of ¥1.4 trillion at the end of 2023. In addition, the issuance of digital securities using blockchain technology is also increasing, and is expected to exceed ¥300 billion in 2025. Currently, most of these relate to real estate assets, but coverage is now expanding to include corporate bonds and unlisted stocks.
